2 Reference Material

This section records information for easy reference.

2.1 Table of Units

Throughout this document SI (Système International d’Unités) is employed as the unit system. In addition to the basic units, several derived units are used as described below. For each unit, the symbol is given followed by a description of the unit and the SI name.

symbol	unit	SI
rad	angle	radian

2.2 Table of Symbols

The table that follows summarizes the symbols used in this document along with their units. The choice of symbols was made to be consistent with the physics and calculus notation. The symbols are listed in alphabetical order.

symbol	unit	description
\mathbb{R}	—	Real numbers. [I suggest you be more precise and define this as the set of all real numbers. The same comment applies for the set of all integers. —SS]
\mathbb{Z}	—	Integers.
ψ	rad	Angle between the normal and halfway vector.
θ	rad	Angle between the viewer and the reflected ray.
$\angle\theta_i$	rad	Angle of incidence between incident ray and surface normal. [Why use the angle symbol for just these two angles? Are they different in some way? If not, I suggest you get rid of the symbol. It seems inconsistent. —SS]
$\angle\theta_r$	rad	Angle of reflection between reflected ray and surface normal.
θ_1	rad	Angle of incidence between incident ray and surface normal in material 1.
θ_2	rad	Angle of refraction between refracted ray and surface normal in material 2.
n_1	—	Refractive index of first material.
n_2	—	Refractive index of second material.
n_i	—	Refractive index of i-th material.
p	—	Point in space or on a surface.

p_0	—	Point of origin.
v	—	Position of viewer represented as a 3D point in space.
P	—	n -dimensional Vector.
P_x	—	x dimension of Vector P .
P_y	—	y dimension of Vector P .
P_z	—	z dimension of Vector P .
P_i	—	i th dimension of Vector P .
Q	—	n -dimensional Vector.
Q_x	—	x dimension of Vector Q .
Q_y	—	y dimension of Vector Q .
Q_z	—	z dimension of Vector Q .
Q_i	—	i th dimension of Vector Q .
\vec{L}_i	—	Vector form of incident ray.
\vec{L}_r	—	Vector form of reflected ray.
\vec{v}	—	Vector from point to the viewer.
\vec{n}	—	Vector form of surface normal.
\vec{N}	—	Unit vector of surface normal, \vec{n} .
\vec{U}_{L_i}	—	Unit vector of incident ray, L_i .
\vec{h}	—	Unit vector halfway between the incident ray, L_i , and the viewer vector, \vec{v} .
I	—	Intensity (Luminance) of Light Source. [Doesn't luminance have units? candela per meter squared? https://en.wikipedia.org/wiki/Luminance —SS]
I_{L_i}	—	Intensity (Luminance) of Light Source L_i .
I_a	—	Ambient Luminance.
I_{ar}	—	Red Colour Ambient Luminance.
I_{ag}	—	Green Colour Ambient Luminance.
I_{ab}	—	Blue Colour Ambient Luminance.
k_a	—	Coefficient of Ambient Reflection.
I_d	—	Diffuse Luminance.
I_{dr}	—	Red Colour Diffuse Luminance.
I_{dg}	—	Green Colour Diffuse Luminance.
I_{db}	—	Blue Colour Diffuse Luminance.
k_d	—	Coefficient of Diffuse Reflection.
I_s	—	Specular Luminance.
I_{sr}	—	Red Colour Specular Luminance.

I_{sg}	–	Green Colour Specular Luminance.
I_{sb}	–	Blue Colour Specular Luminance.
k_s	–	Coefficient of Specular Reflection.
α	–	Shininess Coefficient.
I_T	–	Total Luminance.
i	–	Intensity of light. [What is the difference between luminance and intensity? I've looked over your document and this still confuses me. If they are the same thing, you should just use one term. If they are different, you need to clarify the difference. I did a quick google search and it looks like the units of intensity are lux? —SS]
$i(p)$	–	Intensity of light at a point p .
$i(p, p_0)$	–	Intensity of light from point p at a point p_0 .

3 Introduction

An important part of computer graphics is modeling the lighting of objects in a virtual environment. Understanding and modeling how light interacts with objects of different materials is necessary to provide realistic lighting to virtual environments. Having an open source lighting model library that is reliable and robust would allow for new computer graphics programmers to more efficiently create scenes.

The following section provides an overview of the Commonality Analysis for a family of lighting models. This section explains the purpose of the document, scope of the family, characteristics of the intended reader, and organization of the document.

3.1 Purpose of Document

This document describes a family of lighting models to be used for computer graphics. This document is intended to be used as a reference to provide the necessary information to verify the family of models, and implement the different family members.

This document captures the problem domain, theoretical models used to address the problem, the commonalities and variabilities between members of the family, and the requirements common to those members. It serves as a starting point to the design and implementation of a library of lighting models, and will be referenced in the creation of a verification and validation plan.

3.2 Scope of the Family

Figure 1: Problem Domain for Lighting Models of Computer Graphics.

The problem domain for lighting models in computer graphics is broad (Fig. 1). To simplify this problem we invoke assumptions AS1, AS2, AS4. This allows us to focus on the parts of the problem connected by the orange line.

The scope of the family includes geometrical optics simulation of light reflection for 3D material objects in a local illumination context.

[Can you please explain this scope figure? It looks like you have put some great thinking into coming up with it, and it serves an important purpose, but the words in the figure are not enough to explain the distinction between the different branches. —SS]

3.3 Characteristics of Intended Reader

The intended readers of this document should have understanding of Grade 12 Physics (particularly Optics) and a undergraduate Level 2 understanding of Linear Algebra and Matrix operations.

3.4 Organization of Document

This document is organized in accordance with the CA template for scientific computing software provided by Dr. Smith for CAS 741. These templates are based on work by Smith (2006).

4 General System Description

This section identifies the interfaces between the system and its environment, describes the potential user characteristics and lists the potential system constraints.

4.1 Potential System Contexts

Figure 2 shows the high level system context. The circle represents the system user. The box is the library of lighting models system. Arrows are used to show the flow of data between the system and its environment.

Figure 2: High level system context for Family of Lighting Models

- User Responsibilities:

- Ensure that the problem they are looking to solve matches the assumptions made for this family.
- Provide information on the light source(s), object(s) in scene, and observer position.
- Declare shading model to use from preset options.
- Declare lighting model to use from present options.
- Ensure application programming interface use complies with the user guide.
- Family of Lighting Models Responsibilities:
 - Calculate the reflections of all light rays coming from the light source(s).
 - Determine which light rays (reflected or from source) reach the observer.
 - Render a lit environment based on selected shading and lighting model.
 - Update the calculations and render in response to changes in the input data.
 - Detect data type mismatch, such as a string of characters instead of a floating point number.

4.2 Potential User Characteristics

The end user of Family of Lighting Models should have an Computer Science/Software Engineering Undergraduate Level 3 understanding of Computer Graphics (such as through completing the SFWR ENG/CS 3GC3) and moderate experience with programming.

4.3 Potential System Constraints

There are no system constraints.

5 Commonalities

This section presents a high-level view of the problem. It captures terminology and definitions relevant to the problem, theoretical models that are common to all members of the family, goal statements of the family, data definitions that will be used to solve these problems, as well as commonalities in inputs, calculations, and outputs.

This section also provides a background overview which explains the motivation for this work.

5.1 Background Overview

Computer graphics and the techniques developed therein have become extremely useful in a variety of fields. Animation, games and media all rely on computer graphics to render semi-realistic images for their applications. As we move into an era of virtual and augmented

reality we see that computer graphics has a place beyond the scope of entertainment. Training and rehabilitation simulations are extremely popular uses for computer graphics.

Modeling the interaction of light in realistic ways is difficult for computers. As such it becomes essential to have mostly accurate approximations of lights behaviours that can be used to render scenes in near real-time. On top of the need for efficient approximations, it's imperative to make the libraries and programs that handle lighting easy to use. It would create an incredibly high learning curve if users needed to understand all of the linear algebra and physics behind the approximations to mock up a scene. Existing paradigms for graphics coding offer APIs to try and make it more user friendly, but there is still a disproportionate focus in graphics to manually fixing the scene and matrix manipulations.

The broad purpose of this work is to abstract the details of lighting in computer graphics. We aim for end-users to specify their objects and light sources, and have the system render a fully lit and shaded scene. This type of work would be useful in teaching lighting model concepts, as it would easily allow for switching between different models. More concretely the exercise of understanding the family of lighting models would allow for future students to review this creation process and have a deeper understanding of lighting in computer graphics. Outside of academia, it would similarly be useful for individuals working on small scale graphics problems, like prototyping a simulation environment. Work like this would allow them to not worry about the math involved in getting the environment lit adequately, and instead to focus on their more abstract problem.

5.2 Terminology and Definitions

This subsection provides a list of terms that are used in the subsequent sections and their meaning, with the purpose of reducing ambiguity and making it easier to correctly understand the requirements. Definitions are borrowed or synthesized from [Lengyel \(2003\)](#); [Comninos \(2005\)](#); [Shreiner and Angel \(2012\)](#).

Geometrical Optics: The study of lights as rays.

Ray: A view of light as a continuous beam, represented as a vector.

Reflection: The redirection caused by collision of light rays with objects.

Specular reflection: Perfect reflection of a light ray on a smooth/glossy surface. This is used to create highlights on objects, or create highly reflective objects like mirrors.

Diffuse (Lambertian) reflection: Reflected light ray is scattered in random directions due to microfacets in the surface. This type of reflection does not depend of the position of an observer.

Refraction: The redirection of light rays when passing through different materials.

Illumination: Process by which amount of light reaching a surface is determined.

Shading: methods used to determine the colour and intensity of light reflected towards viewer.

Lighting model: Method used to calculate the colour of a point on a surface. Incorporates a reflection model and a shading model.

Reflection model: How light reflects off a surface.

Shading model: How the normal vector is calculated for polygons in the scene.

Light source: The origin of light rays.

Ambient light: Light with no identifiable source or direction. It has equal intensity in every direction, and illuminates every part of an object uniformly.

Directional (or infinite) light: Light defined only by direction; light travels infinitely in that single direction with constant intensity.

Point light: Light defined only by a point; light travels uniformly in every direction from that point, with intensity decreasing with inverse square of distance from source.

Spotlight: Light defined by a point and direction; light travels infinitely in a single direction from the defined source point with intensity decreasing with inverse square of distance from source and increased radius of coverage.

Scene: A collection of objects with specific material properties.

Object: Set of polygons, edges, and vertices.

Polygon: Closed shape (with well defined interior and exterior).

Normal: A vector perpendicular to a surface, point, or pair of vectors.

5.3 Data Definitions

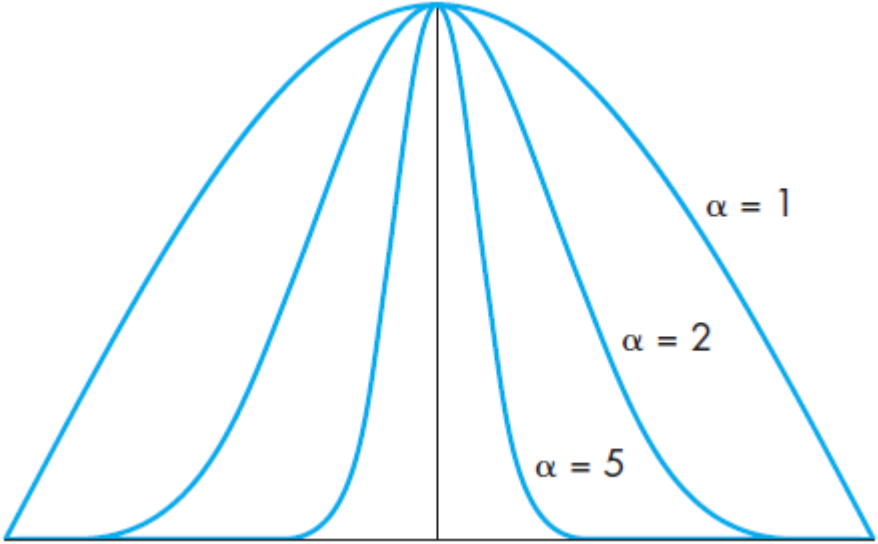

This section collects and defines all the data needed to build the instance models. The dimension of each quantity is also given.

Number	DD1
Label	Dot Product of two n-dimensional vectors
Symbol	$P \bullet Q$
SI Units	–
Equation	$P \bullet Q = \sum_1^n P_i Q_i$
Description	P and Q are two n -dimensional vectors. The dot product ($P \bullet Q$) is the scalar sum of the products of each component. The dot product acts a measure of the difference between the directions in which P and Q point. P and Q are perpendicular when $P \bullet Q = 0$. This is used in T1 and GD1.
Sources	Lengyel (2003)
Ref. By	AB1, AB2

Number	DD2
Label	Cross Product of two 3-dimensional vectors
Symbol	$P \times Q$
SI Units	–
Equation	$P \times Q = \langle P_y Q_z - P_z Q_y, P_z Q_x - P_x Q_z, P_x Q_y - P_y Q_x \rangle$ [Do you consistently use angle brackets to define vectors? I think it would be a good idea to include a section in the Reference Material section that explains your notational conventions. —SS]
Description	P and Q are two 3-dimensional vectors. The cross product ($P \times Q$) is the unit vector normal to both P and Q . The calculation of the cross product's direction follows the <i>right hand rule</i> paradigm. This is used in T1 and GD1.
Sources	Lengyel (2003)
Ref. By	AB1, AB2

Number	DD3
Label	Ambient Luminance for a Light Source
Symbol	I_a
SI Units	– [I wrote this elsewhere, but shouldn't luminance have units? —SS]
Equation	$I_a = \begin{Bmatrix} I_{ar} \\ I_{ag} \\ I_{ab} \end{Bmatrix} = I_{L_i} \cdot k_a$
Description	<p>I_{L_i} is the intensity of the light source - it is uniform for ambient light and shouldn't rely on position.</p> <p>k_a is the coefficient of ambient reflection. [Please define all of the symbols in all of your DDs, GDs, etc. —SS]</p>
Sources	Shreiner and Angel (2012)
Ref. By	IM1, IM2, IM3, IM4

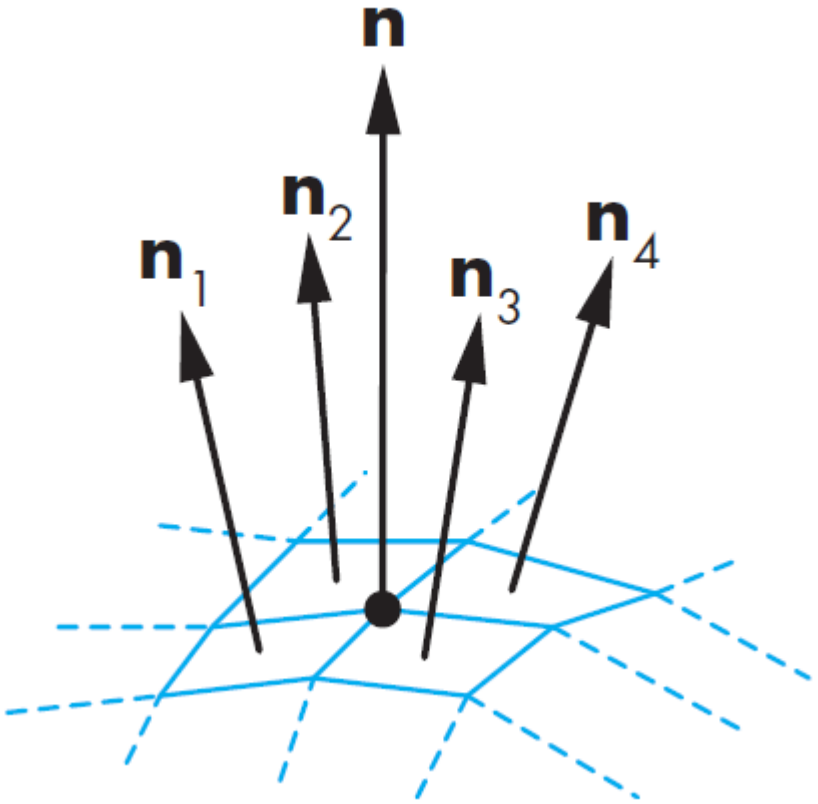

Number	DD4
Label	Diffuse Luminance for a Light Source
Symbol	I_d
SI Units	–
Equation	$I_d = \begin{Bmatrix} I_{dr} \\ I_{dg} \\ I_{db} \end{Bmatrix} = k_d \cdot I_{L_i}(p)(\vec{U}_i \bullet \vec{N})L_d$
Description	<p>p is the point where \vec{L}_i hits the surface.</p> <p>$I_{L_i}(p)$ is the intensity of L_i at point p.</p> <p>k_d is the coefficient of diffuse reflection.</p> <p>\vec{U}_i is the unit vector of L_i.</p> <p>\vec{N} is the unit vector surface normal.</p>
Sources	Shreiner and Angel (2012)
Ref. By	IM1, IM2, IM3, IM4

Number	DD5
Label	Specular Luminance for a Light Source
Symbol	I_s
SI Units	–
Equation	$I_s = \begin{cases} I_{sr} \\ I_{sg} \\ I_{sb} \end{cases} = k_s L_s \max((\vec{U}_r \bullet \vec{v})^\alpha, 0)$
Description	<p> p_0 is the position of the light source in Cartesian Coordinates. \vec{U}_r is the unit vector of the reflected ray. \vec{v} is the vector to the viewer. k_s is the specular coefficient of the material. α is the shininess coefficient to determine the size of the specular highlight. </p> 
Sources	Shreiner and Angel (2012)
Ref. By	IM3, IM4

Number	DD6
Label	Total Luminance for a Light Source
Symbol	I_T
SI Units	–
Equation	$I_T = I_a + I_d + I_s$
Description	Total luminance is the combination of ambient, diffuse, and specular luminance.
Sources	Shreiner and Angel (2012)
Ref. By	IM3

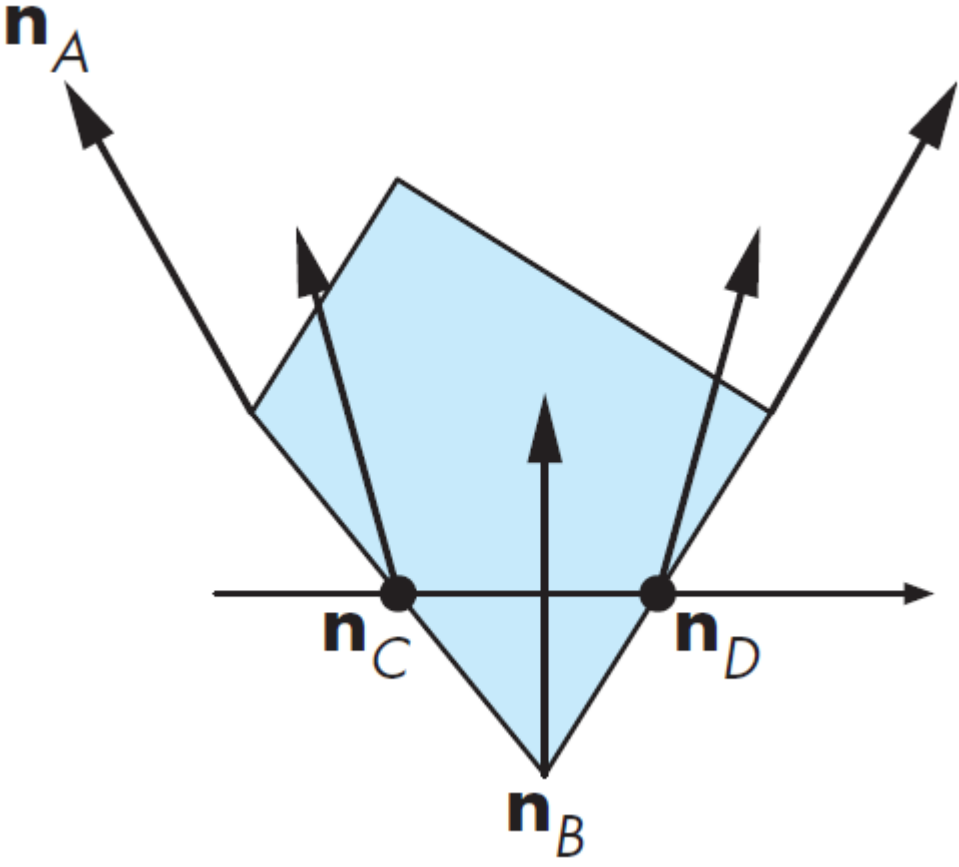

Number	DD7
Label	Intensity of illumination at point p from a point source, p_0
Symbol	$i(p, p_0)$
SI Units	–
Equation	$i(p, p_0) = \frac{1}{ p-p_0 ^2} I(p_0)$
Description	Calculates the intensity of light at point p from a light source at position p_0 in Cartesian Coordinates.
Sources	Lengyel (2003)
Ref. By	AB1, AB2

Number	DD8
Label	Calculation of Normals for Flat Shading
Symbol	\vec{n}
SI Units	–
Equation	$\vec{n} = \frac{\vec{P} \times \vec{Q}}{ \vec{P} \times \vec{Q} }$
Description	Flat shading calculates the surface normal of a polygon in a mesh. Given two non-parallel vectors tangent to the surface of the polygon, \vec{P} and \vec{Q} , the normal (\vec{n}) is the normalized cross-product of \vec{P} and \vec{Q}
Sources	Shreiner and Angel (2012)
Ref. By	AB1, AB2

Number	DD9
Label	Calculation of Normals for Gouraud Shading
Symbol	\vec{n}_v
SI Units	–
Equation	$\vec{n}_v = \frac{\sum_{i=1}^{t_v} \vec{n}_i}{ \sum_{i=1}^{t_v} \vec{n}_i }$
Description	<p>Gouraud shading calculates the normal at the vertices of a polygon in a mesh. Given a vertex, v, the normal (\vec{n}_v) is the normalized average of the surface normals (\vec{n}_i) for all polygons that share that vertex. t_v is the number of polygons that share the vertex v.</p> 
Sources	Shreiner and Angel (2012)
Ref. By	AB1, AB2

[You talk about surfaces, and polygons, but I don't see how you actually represent an object. Searching through again, I see that objects have a set of possible shapes, but I don't

see the connection between the shapes and polygons. The shapes are mathematical defined, especially something like a sphere or a cube. I think you need to say somewhere that you approximate the shape with a mesh of polygons. You might want to look at the commonality analysis of mesh generators that I wrote with a student years ago. It should be in our cas741 repo under CAS 04-10-SS.pdf. —SS]

Number	DD10
Label	Calculation of Normals for Phong Shading
Symbol	\vec{n}_v
SI Units	–
Equation	
Description	<p>Phong shading linearly interpolates normals across each the surface of the polygon from the vertex normals. Surface normals are then normalized per pixel.</p> 
Sources	Shreiner and Angel (2012)
Ref. By	AB1, AB2

5.4 Goal Statements

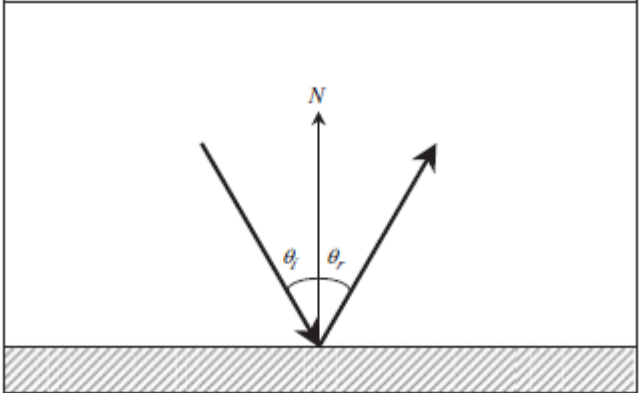

Given some light source(s), some object(s) and their respective material properties, and an observer the goal statements are:

GS1: Render a fully lit and shaded scene of the objects based on the observer location.

[I like this goal statement. However, I feel like the rest of the document doesn't completely refine it. I feel like there should be an instance model that takes the refined version of these inputs and outputs a refined version of the output. —SS]

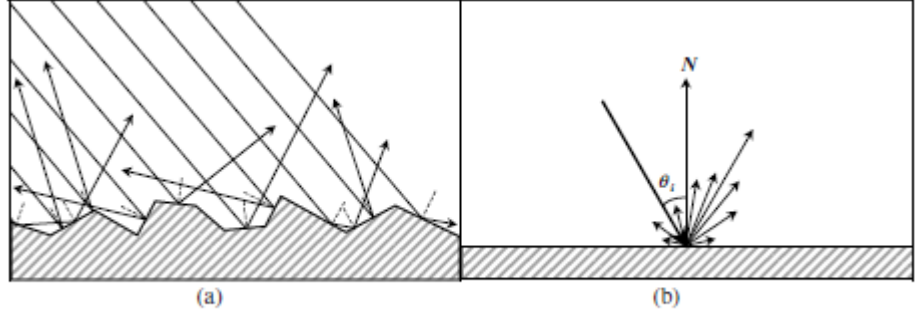

5.5 Theoretical Models

This section focuses on the general equations and laws that Family of Lighting Models is based on.

Number	T1
Label	Law of Reflection
Equation	$\angle\theta_i = \angle\theta_r$ or $\vec{L}_i \bullet \vec{N} = \vec{L}_r \bullet \vec{N}$
Description	<p>When a ray of light reflects off a surface, the angle of incident is equal to the angle of reflection. This can also be written as the dot product of the incident ray and the normal is equal to the dot product of the reflected ray</p>  <p>and the normal.</p>
Source	Comninos (2005)
Ref. By	GD1

5.5.1 General Definitions

This section collects the laws and equations that will be used in building the instance models.

Number	GD1
Label	Diffuse Reflection
SI Units	-
Equation	$\angle\theta_i = \angle\theta_r$ or $\vec{L}_i \bullet \vec{N} = \vec{L}_r \bullet \vec{N}$
Description	<p>Law of Reflection applied to rough surfaces.</p>  <p>(a) The surface micro-facets. (b) Diffuse reflection.</p>
Source	Comninos (2005)
Ref. By	DD1

6 Variabilities

The follow section outlines variabilities between family members. Section 6.1 covers the assumptions made to simplify/realise the problem. Section 6.2 captures variabilities in the implementation.

Before tackling those sections, we summarize here variabilities in the problem.

6.1 Assumptions

This section outlines the various assumptions made in defining this problem. These are divided based on their binding time. All assumptions are used to support the 1

- **Scope Time Bindings:**

AS1: Light will be defined by Geometrical Optics principles (ray-based).

AS2: Lighting will be handled at the local illumination level.

AS3: Objects will not cast shadows on each other.

AS4: Objects will not reflect light at each other.

AS5: Objects will not emit light.

- **Build Time Bindings:**

AB1: The virtual environment will be described by a 3D Cartesian Coordinate System using right-hand rules.

AB2: Positions of light source(s), object(s), and the observer will be defined on a 3D Cartesian Coordinate System.

AB3: There will only be a single observer in a scene.

AB4: Objects will be represented by a geometric mesh of triangles.

AB5: Object meshes will be closed and convex (there is a well defined interior and exterior).

AB6: All objects are opaque; light will not experience refraction with any object.

- **Run-Time Bindings:** These were captured as inputs to the system.

[The scope time bindings make sense, but I am not sure how to interpret the building time bindings. Since they are build time, I'm assuming that whether they apply or not is a build time decision. Is this correct? If so, it feels like if the assumptions do not apply another assumption will have to take its place, but I don't know what that assumption is. For instance, if the object is not represented by a mesh of triangles, what is it represented by? —SS]

[I see the connection between the objects and their representation by polygons is given here. I mentioned this in an earlier comment, but I had missed this mention. However, I think you still need more information. What does it mean to represent an object by a mesh? In the mesh generator CA that I mentioned in an earlier comment a mesh is defined as covering up of a domain, with several rules. You might want to look at that definition. —SS]

[Is the dimension of the problem a variability, or are lighting problems in 3D? —SS]

6.2 Calculation

This section outlines variabilities in design details, capturing variabilities in: input, calculations, algorithms, and data structures.

Input variabilities:

Variability	Parameter of Variation	Constraints	Related
Model room size $\langle h, w, d \rangle$	Set of \mathbb{R} [The types don't match. You have a vector? tuple? of 3 real numbers for the size of the room, but the parameters of variation is a set of real numbers. — SS]	—	AB2
Allowed values for position of light source $\langle x, y, z \rangle$	Set of \mathbb{R} [The same comment as above applies. — SS]	Must be in room boundaries. Light source cannot be inside of an object. Light source cannot be on top of another light source or on top of the observer.	AB2
Allowed values for position of object(s) $\langle x, y, z \rangle$	Set of \mathbb{R}	Object(s) must be in room boundaries. Objects must not overlap with each other or a light source	AB2
Allowed values for position of observer $[x, y, z]$	Set of \mathbb{R}	Observer must be in room boundaries.	AB2
Allowed values for colour of light $\langle r, g, b \rangle$	Set of \mathbb{Z}	0 - 256	—
Allowed values for colour of object $\langle r, g, b \rangle$	Set of \mathbb{Z}	0 - 256 [Why not just define a type for the integers between 0 and 256? A similar comment applies elsewhere in this table. — SS]	—
Reflection coefficient of material	$k_a \in \mathbb{R}$	$0 \leq k_a \leq 1$	—
Specular coefficient of material	$k_s \in \mathbb{R}$	$0 \leq k_s \leq 1$	—
Diffuse coefficient of material	$k_d \in \mathbb{R}$		—
Shininess coefficient of material	$\alpha \in \mathbb{R}$	—	—
Type of light source	Set of $\{Point, Spot, Directional, Ambient\}$	—	—
Type of object(s)	Set of $\{Sphere, Cube, Torus, Teapot\}$	—	—
Type of shading	Set of $\{Flat, Gouraud, Phong\}$	—	—
Number of object(s)	Set of \mathbb{R}	—	—
Number of light(s)	Set of \mathbb{R}	—	—

Calculation variabilities:

Variability	Parameters of Variation	Constraints	Ref.
Interpolation of normals for shading	Set of {DD8, DD9, DD10}	–	AS1

Table 2: Parameters of Variation in Calculations.

6.2.1 Instance Models

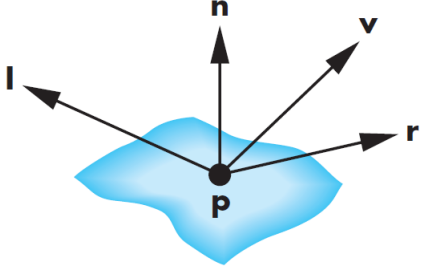

This section transforms the problem defined in Section 3.2 into one which is expressed in mathematical terms. It uses concrete symbols defined in Section 5.3 to replace the abstract symbols in the models identified in Sections 5.5 and 5.5.1.

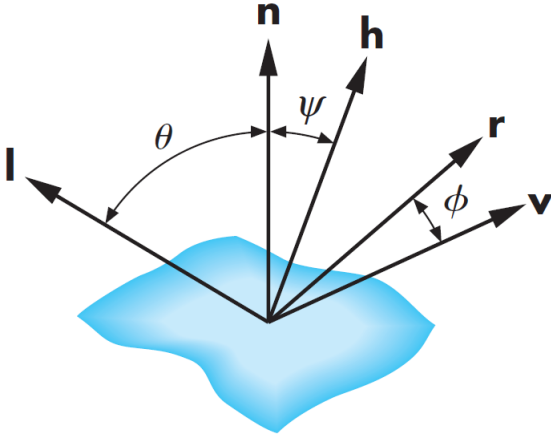

Number	IM1
Label	Lambertian (Diffuse) Reflection Model
Input	$\vec{L}_i, p_0, \text{object}$
Output	\vec{L}_r I_d
Description	<p>L_i is the vector representation of the incident ray.</p> <p>U_i is the unit vector of L_i.</p> <p>\vec{N} is the surface normal unit vector.</p> <p>p_0 is the point the incident ray intercepts the surface of an object.</p> <p>k_d is the coefficient of diffuse reflection.</p> <p>$I_{L_i p_0}$ is the intensity of the light at point P</p> <p>This IM is a concrete refinement on GD1 by modeling the interactions of a single light ray at a single point.</p>
Sources	Comninos (2005); Lengyel (2003); Shreiner and Angel (2012)
Ref. By	IM2

[As Peter pointed out on GitHub, the instance models are incomplete. Think about refining the inputs and outputs. Including type information with the inputs could help. In particular, object is still vague at this point, and you need it to be precise before you can do

a calculation. How the outputs are calculated is also needed. —SS]

Number	IM2
Label	Half Lambert (Diffuse) Reflection Model
Input	$\vec{L}_i, p_0, \text{object}$
Output	\vec{L}_r I_d
Description	<p>L_i is the vector representation of the incident ray.</p> <p>U_i is the unit vector of L_i.</p> <p>\vec{N} is the surface normal unit vector.</p> <p>p_0 is the point the incident ray intercepts the surface of an object.</p> <p>k_d is the coefficient of diffuse reflection.</p> <p>$I_{L_i p_0}$ is the intensity of the light at point P</p> <p>This IM is a concrete refinement on IM1 by halving the dot product of the \vec{U}_i and \vec{N} to create a softer shading.</p>
Sources	Comninos (2005); Lengyel (2003); Shreiner and Angel (2012)
Ref. By	

Number	IM3
Label	Phong Reflection Model
Input	$\vec{n}, p, v, \vec{L}_i, I_{a_{L_i}}, I_{d_{L_i}}, I_{s_{L_i}}$
Output	$\vec{v}, \vec{L}_r, I_{a_{L_r}}, I_{d_{L_r}}, I_{s_{L_r}}$
Description	<p>p is a point on the polygon surface.</p> <p>v is the position of the viewer.</p> <p>\vec{L}_i is the incident ray hitting point p.</p> <p>\vec{n} is the surface normal at point p.</p> <p>$I_{a_{L_i}}$ is the ambient intensity of the light described by L_i.</p> <p>$I_{d_{L_i}}$ is the diffuse intensity of the light described by L_i.</p> <p>$I_{s_{L_i}}$ is the specular intensity of the light described by L_i.</p> <p>\vec{v} is the vector in the direction of the viewer from p.</p> <p>\vec{L}_r is the perfectly reflected ray.</p> <p>$I_{a_{L_r}}$ is the ambient intensity of the light described by L_r.</p> <p>$I_{d_{L_r}}$ is the diffuse intensity of the light described by L_r.</p> <p>$I_{s_{L_r}}$ is the specular intensity of the light described by L_r.</p> 
Sources	Comninos (2005) ; Lengyel (2003) ; Shreiner and Angel (2012)
Ref. By	IM4

Number	IM4
Label	Blinn-Phong Reflection Model
Input	$\vec{n}, p, v, \vec{L}_i, I_{a_{L_i}}, I_{d_{L_i}}, I_{s_{L_i}}$
Output	$\vec{v}, \vec{h}, I_{a_h}, I_{d_h}, I_{s_{L_r}}$
Description	<p>p is a point on the polygon surface.</p> <p>v is the position of the viewer.</p> <p>\vec{L}_i is the incident ray hitting point p.</p> <p>\vec{n} is the surface normal at point p.</p> <p>$I_{a_{L_i}}$ is the ambient intensity of the light described by L_i.</p> <p>$I_{d_{L_i}}$ is the diffuse intensity of the light described by L_i.</p> <p>$I_{s_{L_i}}$ is the specular intensity of the light described by L_i.</p> <p>\vec{v} is the vector in the direction of the viewer from p.</p> <p>\vec{L}_r is the perfectly reflected ray.</p> <p>$I_{a_{L_r}}$ is the ambient intensity of the light described by L_r.</p> <p>$I_{d_{L_r}}$ is the diffuse intensity of the light described by L_r.</p> <p>$I_{s_{L_r}}$ is the specular intensity of the light described by L_r.</p> <p>\vec{h} is the unit vector halfway between \vec{L}_i and \vec{v}</p> <p>ψ is the halfway angle, the angle between the normal and halfway vectors.</p> <p>ϕ is the angle between the viewer and the reflected ray. It is exactly 2ψ.</p>  <p>The diagram illustrates the Blinn-Phong reflection model. It shows a blue irregular polygon representing a surface. From a point on the surface, several vectors originate: \vec{n} (surface normal), \vec{h} (halfway vector), \vec{r} (reflected ray), \vec{v} (viewer vector), and \vec{l} (incident ray). The angle between \vec{n} and \vec{l} is θ. The angle between \vec{n} and \vec{h} is ψ. The angle between \vec{h} and \vec{v} is ϕ. The reflected ray \vec{r} is shown as a vector originating from the same point.</p>

6.3 Output

Variability	Parameter of Variation
Output file	Generated code file that when compiled renders a scene, executable file that shows the rendered scene

Table 3: Parameters of Variation for Output.

7 Requirements

This section provides the functional requirements, the business tasks that the software is expected to complete, and the nonfunctional requirements, the qualities that the software is expected to exhibit.

7.1 Family of Functional Requirements

- R1: The library shall correctly read from file the input data for light source(s) and object(s).
- R2: The library shall verify that all input data meets constraints laid out in Table 1.
- R3: The library shall correctly calculate the surface normals for object(s) based on shading model selected.
- R4: The library shall calculate the incidence and reflection vectors off of object(s) surface(s) based on light position(s), object(s) properties, shading model and observer position.
- R5: The library shall calculate the light intensity based on light position(s), object(s) material properties, and shading model.
- R6: The library shall calculate the total luminance of object(s) faces based on light source type, light source position, object(s) material properties and position(s) and observer position.
- R7: The library will output code for a lit and shaded scene.

[I suggest changing the phrasing of the requirements to say the library offers these services.
—SS]

7.2 Nonfunctional Requirements

- R8: System responds with specific error message when user inputs contain errors (type mismatch, data outside of constraints).
- R9: System responds with specific error message when system cannot read input files.
- R10: System provides a default setup for shading and reflection models.
- R11: System asks user if they would like to use the default setup when shading and reflection model information is missing from input.
- R12: Users can render a default scene (one cube, one point light in the centre of the room, phong shading, and phong reflection model) faster than in OpenGL.

[There is an issue on GitHub about the NFRs here mostly being FRs. —SS]

8 Likely Changes

- LC1: Refractive materials incorporated into family.
- LC2: More reflection models incorporated into family.
- LC3: Variations on how normals are computed (e.g. partial derivatives) may be added to the family.

9 Traceability Matrices and Graphs

10 Appendix

10.1 First Stage of Implementation

[In this section specify the family member, or sub-family, that you will be implementing for CAS 741. You should specify the value for all of your variabilities, along with the binding time. A tabular representation will probably be the easiest way to convey this information. —TPLT]

In this project we will be implementing all of the family members touched by the orange line in Figure 1.

[I think we need more information than this. What are the values of the variabilities in your table? For instance, what objects are you allowing? —SS]
